A comprehensive understanding of protein protein interactions is an important next step in our quest to understand how the information contained in a genome is put into action. Although a number of experimental techniques can report on the existence of a protein protein interaction, very few can provide detailed structural information. NMR spectroscopy is one of these, and in recent years

Proteomics Proteomics is the large-scale study of protein, particularly their structures and functions or The study of the full set of proteins encoded by a genome . This term was coined to make an analogy with genomics (identified the sequence of DNA in species ) and proteomics (systematic study of the complete complement of proteins of organisms).

Interaction Proteomics facilitates the study of protein-protein interactions (PPIs). Dysregulation and inappropriate activation of protein complexes are associated with several diseases, including cancer. These interactions play a vital role in cellular processes and fundamental biological insights can be gained by studying networks of interacting proteins rather than individual proteins.
