[Superheating - Wikipedia](#)

Water is said to "boil" when bubbles of water vapor grow without bound, bursting at the surface. For a vapor bubble to expand, the temperature must be high enough that the vapor pressure exceeds the ambient pressure (the atmospheric pressure, primarily).

[Superheat and Subcooling - Neil Orme](#)

One of the best methods to determine superheat is to use a pipe clamp temperature probe and a pressure/vacuum module in conjunction with a suitable digital multimeter with type K thermocouple measurement and a mV input.
